# SURCHI

## Presale Configuration

Official economic parameters and architectural configuration  
for the SURCHI token presale on the Solana blockchain.

| TOTAL SUPPLY                | HARD CAP          | SOFT CAP          | PRESALE RATE                     |
|-----------------------------|-------------------|-------------------|----------------------------------|
| <b>19,897,905</b><br>SURCHI | <b>600</b><br>SOL | <b>100</b><br>SOL | <b>21,224.43</b><br>SURCHI / SOL |

This document contains the official presale parameters, token allocation model, economic safeguards, and launch highlights for the SURCHI protocol.

SECTION 01

# Token Information

SURCHI is a Solana Program Library (SPL) token operating as the core utility, governance, and value-capture asset of the SURCHI AI protocol. The following parameters define the token's fundamental on-chain characteristics.

| DETAIL          | SPECIFICATION                |
|-----------------|------------------------------|
| Token Name      | SURCHI                       |
| Blockchain      | Solana (SPL Token)           |
| Total Supply    | 19,897,905 SURCHI            |
| Supply Model    | Fixed / Non-Inflationary     |
| Governance      | Community-Controlled (DAO)   |
| Team Allocation | 0% – Zero Insider Allocation |

## SECTION 02

# Token Allocation

The SURCHI token supply is distributed across three segments, each serving a distinct purpose within the protocol ecosystem. The allocation is engineered to maximize community ownership at launch while ensuring robust liquidity infrastructure and long-term ecosystem funding.

| ALLOCATION              | PERCENTAGE | TOKENS     |
|-------------------------|------------|------------|
| Presale                 | 64%        | 12,734,659 |
| Liquidity Pool          | 30%        | 5,969,372  |
| Community Reserve (DAO) | 6%         | 1,193,874  |
| TOTAL                   | 100%       | 19,897,905 |

- 64% Presale — Released at TGE to public participants
- 30% Liquidity Pool — Locked 365 days, multi-sig protected
- 6% Community Reserve — Treasury, grants, staking rewards

**Zero Team Allocation · Zero Advisor Allocation · Zero Private Round 100% of supply flows to the public, liquidity, and the DAO treasury.**

SECTION 03

# Presale Structure

The presale is configured with a liquidity-first economic model. Parameters are designed to prioritize market stability, investor confidence, and long-term protocol health over short-term capital extraction.

| CONFIGURATION    | DETAILS                | CONFIGURATION  | DETAILS                    |
|------------------|------------------------|----------------|----------------------------|
| Soft Cap         | 100 SOL                | Liquidity Rate | 70%                        |
| Hard Cap         | 600 SOL                | Liquidity Lock | 365 Days                   |
| Presale Rate     | 21,224.43 SURCHI / SOL | Minimum Buy    | 0.05 SOL                   |
| Presale Duration | 30 Days                | Maximum Buy    | 10 SOL                     |
| Listing Type     | Auto Listing           | Unsold Tokens  | External Liquidity Reserve |

## Capital Thresholds

The presale operates between a soft cap of 100 SOL and a hard cap of 600 SOL. Reaching the soft cap activates liquidity deployment. Reaching the hard cap concludes the presale and triggers auto-listing.

|          |                                     |         |
|----------|-------------------------------------|---------|
| SOFT CAP | (Minimum for Liquidity Activation)  | 100 SOL |
| HARD CAP | (Maximum Raise / Auto-List Trigger) | 600 SOL |

## SECTION 04

## Presale Rate & Buy Examples

The presale exchange rate is fixed at **1 SOL = 21,224.43 SURCHI**. The following examples illustrate token quantities received at different investment amounts, from the minimum buy threshold to the maximum single purchase limit.

**1 SOL****=****21,224.43 SURCHI**

| TIER         | SOL INPUT | SURCHI RECEIVED     | NOTE                       |
|--------------|-----------|---------------------|----------------------------|
| Minimum Buy  | 0.05 SOL  | ≈ 1,061.22 SURCHI   | Entry-level participation  |
| Standard Buy | 1.00 SOL  | ≈ 21,224.43 SURCHI  | Base rate — 1:21,224 ratio |
| Maximum Buy  | 10.00 SOL | ≈ 212,244.32 SURCHI | Single wallet maximum      |

All amounts are calculated at the fixed presale rate of 21,224.43 SURCHI per SOL. Actual received amounts may vary slightly due to on-chain rounding. Minimum buy: 0.05 SOL · Maximum buy: 10.00 SOL per wallet.

## SECTION 05

# Liquidity Model & Economic Safeguards

SURCHI's presale is designed around a liquidity-first economic philosophy. Rather than maximizing short-term capital retention, the protocol commits a significant majority of raised funds directly to market liquidity — creating a stable, well-capitalized trading environment from day one.

## Liquidity Allocation of Raised Funds

## The Four Economic Safeguards

### Liquidity-First Design

70% of all raised funds are immediately committed to the protocol's liquidity pool at launch, ensuring deep, stable markets from day one and reducing volatility for all participants.

### 365-Day Liquidity Lock

All liquidity pool tokens are time-locked for a minimum of 365 days. This lock is enforced by smart contract, publicly verifiable on-chain, and cannot be modified by any party — including core contributors.

### Unsold Token Policy

Any tokens not distributed during the presale period are not burned or allocated to the team. Instead, they are reserved and redirected toward external liquidity addition — further deepening market liquidity and preventing post-launch volatility from supply uncertainty.

### Solana-Native Infrastructure

Built on Solana's high-speed, low-fee blockchain, the presale and subsequent protocol operations leverage sub-cent transaction costs and ~400ms finality — ensuring a smooth, accessible experience for all participants regardless of investment size.

**At hard cap (600 SOL raised): 420 SOL flows directly to the liquidity pool at launch — creating a well-capitalized, manipulation-resistant market from day one.**

## SECTION 06

# Launch Highlights

## Liquidity-First Design

70% of raised funds are committed to the liquidity pool at launch. This is not a promise — it is a hard-coded economic parameter enforced at the smart contract level.

## Built-In Security

A 365-day liquidity lock is embedded in the presale architecture, ensuring project longevity and providing investors with verifiable, on-chain evidence of the team's long-term commitment.

## Market Stability by Design

Unsold tokens are redirected toward future external liquidity expansion rather than being dumped on the market or reallocated to insiders, preventing volatility from supply uncertainty.

## Solana Native

SURCHI leverages Solana's high-speed, low-fee infrastructure — providing the foundation for a scalable, AI-powered Web3 ecosystem with sub-cent interaction costs and high throughput.

## Zero Insider Risk

No team allocation, no advisor allocation, no private round. The zero-insider tokenomic model eliminates the single most common source of catastrophic value destruction in DeFi: coordinated insider selling at vesting cliffs.

## Quick-Reference Summary

| PRESALE PARAMETER | VALUE                    |
|-------------------|--------------------------|
| Presale Rate      | 1 SOL = 21,224.43 SURCHI |
| Soft Cap          | 100 SOL                  |
| Hard Cap          | 600 SOL                  |
| Duration          | 30 Days                  |

|                |                                 |
|----------------|---------------------------------|
| Min Buy        | 0.05 SOL ≈ 1,061.22 SURCHI      |
| Max Buy        | 10.00 SOL ≈ 212,244.32 SURCHI   |
| Liquidity Rate | 70% of raised funds             |
| Liquidity Lock | 365 Days (Smart Contract)       |
| Listing Type   | Auto Listing                    |
| Unsold Tokens  | Reserved for External Liquidity |
